When investing in a security solution to protect all your devices and the data they contain, the effectiveness of the solution is contingent upon many factors. To ensure it starts out on the right footing, however, no factor is more important than ensuring the solution is deployed correctly with an effective implementation and on-boarding strategy.

Absolute’s cloud-based platform for Endpoint Visibility & Control combines patented embedded Persistence® technology, giving you always-on visibility and real-time remediation to protect devices, data, applications and users – on and off your network.

Our solution gives you the power to see and act against potential security threats across your entire device deployment. But if the solution is not optimally configured and lacks the proper education and training to indoctrinate your IT team and encourage user adoption, the exciting decision you’ve made to invest in a security solution may be plagued by underwhelming utilization rates. This could result in costly security vulnerabilities, the very threats and risks you initially set out to eliminate and avoid in selecting a security solution.

That’s why QuickStart Services are included with each Absolute license. They are designed to help you deploy your Absolute solution with confidence, fast-track your time-to-value, and reduce implementation risk. They are conveniently packaged to complement your deployment size and scope and include an assortment of the following critical processes, aligning to your specific organizational objectives.

- Installation
- Knowledge Transfer
- Advanced Configuration and Deployment Support
- Business Process Reviews
- Governance
- Project Management

QuickStart Services are included with Absolute subscriptions of 50 or more licenses. Deployments of over 10,000 licenses will require a custom Implementation Services engagement, which can be quoted upon request. Please speak with your Sales Representative.
